GUIDANCE ON THE PREVENTION, DIAGNOSIS AND MANAGEMENT OF VITAMIN D DEFICIENCY IN PRIMARY CARE

This guidance is based on national recommendations from NICE (PH56) and the National Osteoporosis Society.

JAPC recommends the prescribing on the NHS of high-dose vitamin D only as a short-course treatment, for the correction of diagnosed deficiency for adults and children.

For all other vitamin D requirements, JAPC recommends that the patient is encouraged to make lifestyle changes such as increasing dietary intake of vitamin D, increasing safe sun exposure and to purchase a supplement over the counter from a local pharmacy, health food shop or supermarket.

See [position statement on the prescribing of vitamin D](#) for further advice

Summary

- It is estimated that almost a fifth of the UK population have a low vitamin D status. Prescribers should note local variation of definition. For example NICE classify low vitamin D as <25nmol/litre whereas Derbyshire use <30nmol/litre (see shared care pathology guideline for more detail). CRHFT are updating their reporting to align themselves to local guidance.

For this reason:
- Routine screening of vitamin D blood levels is not recommended.
- Lifestyle advice and use of over the counter vitamin D preparations are recommended for prevention. Patient information resources are included in this guideline.
- The government Healthy Start Scheme offers free vitamin supplements (containing vitamin D) to eligible patients. They can no longer be purchased, but commercial vitamin supplements are available to buy for those people not eligible for the Healthy Start Scheme.
- Prescribing of vitamin D preparations should be reserved for treatment of patients with symptoms AND diagnosed deficiency, usually as a short course of treatment.
- Vitamin D products should be prescribed by its brand name so that the most cost effective licenced product is dispensed. Only use liquid options if capsules or tablets are not suitable. If preferred products are unavailable, please select a suitable licensed alternative.
SUMMARY: Diagnosis and management of Vitamin D deficiency in primary care

Population screening by measuring Vitamin D levels is unnecessary (see section on diagnosis for more information).

Symptoms of rickets or osteomalacia? (See table 1 p5)

Yes

Investigations: U&Es, LFTs, calcium, phosphate, PTH and 25-OH Vitamin D

Vit D <30nmol/l: Prescription*

Vit D 30-50nmol/l: Lifestyle advice on safe sun exposure and diet & OTC supplements*

Vit D >50nmol/l: Normal- no indication for supplementation

Risk factors for Vitamin D deficiency? (See table 2 p6)

No

Yes

Referral to specialist indicated?

- Children under 1 year
- Children with biochemical rickets or raised PTH
- Renal disease (CKD 4&5)
- Atypical biochemistry- including hypercalcaemia
- Failure to respond to treatment after 3 months
- Short stature / skeletal deformity
- Focal bone pain
- Unexplained severe deficiency

No

Yes

Refer

GP to prescribe as per table 3 (p7)

Note

*Cut off for high dose vitamin D prescription
Symptomatic deficiency is unlikely when 25(OH)D is greater than 30 nmol/l but there is no clear threshold. If symptoms are strongly suspected to be vitamin D related it is reasonable to offer high dose treatment when levels are between 30 and 35 nmol/l.

+Prescription of vitamin D occasionally indicated with Specialist advice (e.g. in preparation for parenteral treatment of osteoporosis

Introduction

Vitamin D is essential for skeletal growth and bone health. Severe deficiency can result in rickets (among children) and osteomalacia (among children and adults). It is estimated that almost a fifth of the UK population are deficient in vitamin D (< 25nmol/litre). Example of people that may be at particular risk include:

- Infants and children aged under 5
- Pregnant and breastfeeding women, particularly teenagers and young women.
- People over 65.
- People who have low or no exposure to the sun, for example, those who cover their skin for cultural reasons, who are housebound or confined indoors for long periods.
- People with darker skin, for example. People of African, African-Caribbean or South Asian family origin.

This guideline has been revised for 2015 following the publication of the NICE public health guidance on vitamin D supplementation in at risk groups. Other sources of information include the National Osteoporosis Society ‘Vitamin D and Bone Health’ document and a useful summary of vitamin D prescribing from UKMi. Amendments have also been made in line with the ‘Vitamin D and Health’ document published by the Scientific Advisory Committee on Nutrition 2016.

The document provides information on vitamin D, diagnosis and management of deficiency and advice for patients with insufficiency.

1. Vitamin D physiology:

What is Vitamin D?

- Vitamin D is a group of fat soluble vitamins that is essential for bone formation in all age groups. The 2 main forms are D$_2$ (ergocalciferol), predominantly from plants and D$_3$ (colecalciferol) mainly from animal sources. Both have similar actions. Vitamin D is activated in the liver to 25-hydroxycolecalciferol and then in the kidney to 1,25-dihydroxycolecalciferol (active vitamin D).
- The most well established action of vitamin D is to promote calcium absorption by the GI tract.
- 90% of our daily vitamin requirement is obtained by the action of UVB sunlight on the skin (only during April to September in the United Kingdom). Between October and early March we do not obtain any vitamin D from the action of sunlight on the skin.
- 10% is obtained through diet such as oily fish (sardines, salmon), liver, egg yolks, fortified margarine and fortified breakfast cereals)

Does Vitamin D have other functions?

- Research has identified epidemiological links between vitamin D levels and various disease states. It remains unclear whether vitamin D could offer pharmacological benefit for any of these conditions. At the present time the indications for vitamin D treatment relate to maintenance of calcium homeostasis and bone health via the primary mode of action to aid absorption of calcium at the gut.

2. Diagnosis:

Vitamin D deficiency is best assessed by measurement of serum 25-OH vitamin D. Measurement of other vitamin D metabolites or sub-fractions adds nothing further and is not recommended.

NICE recommends that health professionals should NOT routinely test people’s vitamin D status unless:

- they have symptoms of deficiency - see table 1.
- they are considered to be at particular high risk of deficiency (for example, they have very low exposure to sunlight) – see table 2.
- there is a clinical reason to do so (for example, they have osteomalacia or have had a fall).
Table 1: Clinical features of Vitamin D deficiency

</tbody>
</table>

GPs should consider a diagnosis of vitamin D deficiency in a patient with risk factors (table 2) who presents with chronic musculoskeletal (MSK) pain.

NB. The relationship between chronic MSK pain and vitamin D deficiency is not clear and treatment does not necessarily resolve symptoms.

</tbody>
</table>

Investigations (to be arranged by primary care):

- U&Es, LFTs, calcium, phosphate and 25-OH Vitamin D
- PTH should be measured when the adjusted calcium is significantly low (<2.15)
- Children: In addition, albumin & PTH should be measured routinely in children (refer if PTH high)
- The findings in osteomalacia are a low/normal calcium, low/normal phosphate, raised alkaline phosphatase, low vitamin D and raised PTH (secondary hyperparathyroidism)

Vitamin D levels are expressed as nmol/L (ng/ml x 2.5 = nmol/L).
The definition of vitamin D deficiency and insufficiency is based on blood measurements of 25-OH vitamin D:

- >50 nmol/l Satisfactory Vitamin D levels
- 30-50 nmol/l Vitamin D insufficiency
- <30 nmol/l Vitamin D deficiency

Note: In patients with a Vitamin D level >30 nmol/l, symptoms are unlikely to be due to Vitamin D deficiency. However, clinicians should use clinical judgment when considering the diagnosis and treatment plan for an individual patient.
3. **Management of Vitamin D deficiency (Vitamin D level <30nmol/l)**

Patients meeting the above criteria should be managed according to the following principles:

- For the purposes of this document we define ‘treatment’ to be high dose therapy to reverse vitamin D deficiency. This is different from lower doses used as long term daily ‘supplementation’ or as ‘maintenance’ following high dose treatment.

- Symptomatic patients need high dose colecalciferol treatment to reverse deficiency and eradicate symptoms. Asymptomatic patients should be advised to purchase lower doses of colecalciferol of 800units (20microgram) and deficiency will gradually be resolved. Please note that preparations containing 1000 units (25 micrograms) are considerably cheaper to purchase than those containing 400 units (10 micrograms) or 800 units (20 micrograms). Adult patients can be advised that these are suitable to purchase for this indication.

- When indicated, a single course of high dose therapy should be followed by lifestyle advice and maintenance with lower dose supplementation bought over the counter.

- Available evidence suggests that oral colecalciferol offers greater improvements in serum 25-OH Vitamin D compared with oral ergocalciferol or intramuscular preparations at equivalent doses. As such, oral colecalciferol is the first line treatment option.

- Alfacalcidol and calcitriol are completely inappropriate for treatment of vitamin D deficiency outside of CKD 4-5, due to high risk of toxicity.

**Table 3: Treatment / Maintenance Dosing for Vitamin D** (see summary on page 1 for current brand recommendations)

</tbody>
</table>

Patients who continue to be at risk following deficiency correction, should be encouraged to make lifestyle changes such as increasing dietary intake of vitamin D, increasing safe sun exposure and to purchase a supplement over the counter from a local pharmacy, health food shop or supermarket.

<table>
<thead>
<tr>
<th>Maintenance therapy</th>
<th>Patient should be advised to purchase a supplement containing 800 units (20mcg) daily from their local pharmacy, health food shop or supermarket.</th>
</tr>
</thead>
<tbody>
<tr>
<td>(This can be used as initial treatment in asymptomatic individuals)</td>
<td><strong>Please note that preparations containing 1000 units (25 micrograms) are considerably cheaper to purchase than those containing 400 units (10 micrograms) or 800 units (20 micrograms). Adult patients can be advised that these are suitable to purchase for this indication.</strong></td>
</tr>
<tr>
<td></td>
<td>400-600 units (10-16mcg) daily. To be continued long term. Healthy Start vitamins, Abidec or Dalivit vitamin drops are recommended. Only Children up to the age of 4 years who are entitled through the Healthy Start scheme will continue to receive vitamin supplements through this national scheme.</td>
</tr>
<tr>
<td></td>
<td>Parents of children &gt;4 years in age (and children not entitled through the Healthy Start scheme) are advised to purchase a Vitamin D containing supplement for maintenance treatment (400 – 600 units daily). Babies that are receiving more than 500ml infant formula a day do not require vitamin D supplementation.</td>
</tr>
</tbody>
</table>

| Long term monitoring                   | No routine monitoring or rechecking of serum 25OHD levels is needed whilst on maintenance therapy. Recheck biochemistry if symptoms return or malabsorption/poor compliance suspected. |

---

*Loading regimens for treatment of deficiency up to a total of approximately 300,000 units given either as weekly or daily split doses. The exact regimen will depend on the local availability of vitamin D.*

**The same effect may be achieved by multiplying the dose by seven and giving it weekly if compliance is a concern.*

**Note:** Liquid “specials” of vitamin D (unlicensed) should NOT be routinely prescribed. Cost effective alternatives are available.

4. **Management of Vitamin D insufficiency:**

i.e.: Vitamin D level 30-50nmol/l AND risk factors for Vitamin D deficiency

Patients should be offered lifestyle advice and advised to purchase vitamin D supplements over the counter (OTC) at doses outlined in table 3 for maintenance therapy. Healthy start vitamins are available for children <5years. Example patient information leaflets can be found in Appendix 1.
Use of colecalciferol supplements (purchased over the counter) are specifically recommended for patients with 25-OH Vitamin D 30-50 nmol/l and one of the following additional factors:

- fragility fracture, osteoporosis or high fracture risk including patients on antiresorptive medications
- increased risk of future deficiency due to e.g. reduced exposure to sunlight, cultural dress code, dark skin
- raised PTH
- regular prescription for antiepileptic drugs or glucocorticoids
- malabsorption

**Lifestyle advice for Vitamin D insufficiency (and deficiency)**

**Sun exposure:** Sun exposure is the main source of vitamin D and should be exploited! However, this should be balanced with the risks of excessive exposure. Time required in the sun to make sufficient vitamin D is generally short and less than the time needed for skin to burn. This should be adjusted on an individual basis and safe practices adopted. Little and often is best.

The following advice was given in the New England Journal of Medicine (2007): “Exposure of arms and legs for 5 to 30 minutes (depending on time of day, season, latitude, and skin pigmentation) between the hours of 10 a.m. and 3 p.m. twice a week is often adequate”

Note: Use of creams containing sun protection factors reduces vitamin D synthesis by >95%.

### Diet:

Dietary sources of Vitamin D include:

- Oily Fish – Salmon, Mackerel, Sardines, Herring, Pilchards, Fresh Tuna etc.
- Cod liver oil & other fish oils
- Red meat & Eggs yolk
- Infant formula milk, powdered milk
- Fortified breakfast cereals
- Soya products, fortified margarines, low fat spreads

It is difficult to obtain enough vitamin D from usual diet alone. The average daily intake from a normal diet is just 80-160 units/day (2-4µg). Where supplementation is indicated, the following doses are recommended (Table 4):

<table>
<thead>
<tr>
<th>Table 4: Supplement dosing for Vitamin D</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Age/ group</strong></td>
</tr>
<tr>
<td>Birth to 1 year of age and partially or exclusively breastfed</td>
</tr>
<tr>
<td>Aged 1-4 years</td>
</tr>
<tr>
<td>Limited UVB exposure including due occlusive clothing, low levels of exposure or dark skin</td>
</tr>
<tr>
<td>All individuals not otherwise at risk 5 years of age and above, including pregnant women</td>
</tr>
</tbody>
</table>

**NB:** There is no benefit in using preparations of vitamin D combined with calcium in most patients. However calcium & vitamin D 400-800 units/day maybe appropriate in the elderly, most people aged 65 years or more taking bisphosphonates, and those taking corticosteroids.

OTC supplementation should be continued long term in most patients unless there is a significant lifestyle change to improve vitamin D status.

### 5. Prevention of Vitamin D deficiency in the general population:

Based on the CMO letter 2012, (has been updated following the publication of the SACN guidance) and NICE PH56, May 2017 recommends:
• **From birth up to 1 year of age** - Infants from birth to one year of age, whether exclusively or partially breastfed should be given a daily *supplement containing 8.5-10 micrograms (340 – 400 units) vitamin D.*

Babies fed infant formula should not be given a vitamin D supplement unless they are receiving less than 500mls (17.6 fl oz or about a pint) of formula a day as it is fortified with vitamin D and no other supplementation is required.

• **Ages 1 – 4 years** - parents of children aged 1 - 4 years of age should be encouraged to purchase a daily supplement containing 10 micrograms (400 units) vitamin D. Some children aged 1 – 4 may be entitled to free Healthy Start vitamin drops.

• **General population - ages 4 years and older** – should be encouraged to purchase *10micrograms (400units) vitamin D throughout the year.* (NICE PH56, May 2017). This includes pregnant and lactating women and populations at increased risk of Vitamin D deficiency who should be encouraged to purchase 10micrograms (400units) of vitamin D over the counter. Some pregnant women and new mothers may be entitled to free Healthy Start vitamins.

• **Little or no UVB exposure** - these individuals will not obtain enough vitamin D from sunlight. People from these groups should be encouraged to purchase a daily supplement containing *10 micrograms (400 units) vitamin D* throughout the year. They are:
  o people who are seldom outdoors such as frail or housebound individuals and those who are confined indoors e.g. in institutions such as care homes
  o people who habitually wear clothes that cover most of their skin while outdoors.

• **People from minority ethnic groups** with dark skin such as those of African, African-Caribbean and South Asian origin might not get enough vitamin D from sunlight in summer so they should be encouraged to purchase a *vitamin D supplement containing 10 micrograms (400 units)* throughout the year.

Most of these patients should be offered lifestyle advice as detailed above and advised to purchase supplementation over the counter (eligible patients can obtain free supplements through the Healthy Start scheme). More information on available products for supplementation and the Healthy Start scheme can be found in appendix 2 (p12).

6. **Exceptionalities:**

a. **Primary hyperparathyroidism/ hypercalcaemia and development of new hypercalcaemia during vitamin D replacement**

Patients with Primary Hyperparathyroidism frequently have vitamin D deficiency. Vitamin D deficiency in primary hyperparathyroidism may exacerbate bone loss in this condition.

Treatment with vitamin D has the potential to exacerbate hypercalcaemia and hypercalciuria but is still often indicated. **Specialist advice (Endocrinology) is recommended prior to vitamin D treatment in this context.**

Patients may develop hypercalcaemia during correction of vitamin D deficiency. This can indicate vitamin D toxicity although this would not be expected when using recommended doses. Most other cases are due to underlying and previously undiagnosed Primary Hyperparathyroidism although granulomatous conditions are also relevant (e.g. Sarcoidosis). The diagnosis can be aided by measurement of PTH- and such cases should be referred to Endocrinology for assessment.

b. **Parenteral Osteoporosis treatments**

Parenteral treatments for osteoporosis require adequate vitamin D levels in order to be safe and effective. Follow specialist advice.
7. **Referral:**

The following patients should be referred to secondary care for further investigation:

- Children under 1 year
- Children with biochemical rickets or raised PTH
- Renal disease (CKD 4&5)
- Atypical biochemistry- including hypercalcaemia
- Failure to respond to treatment after 3 months despite good adherence
- Short stature / skeletal deformity
- Focal bone pain
- Unexplained severe deficiency
- Unexplained weight loss
- Children with repeated low serum calcium concentration with or without symptoms (irritability, brisk reflexes, tetany, seizures or other neurological abnormalities)
  - symptomatic: requires immediate referral to A&E if outpatient
  - asymptomatic: discuss treatment with paediatrician
- Children with underlying complex medical disorders (e.g. liver disease, intestinal malabsorption)
- Children with persisting low serum phosphate or low/high alkaline phosphatase

Appendix 1: Patient information: National examples

A variety of patient information are available including:

- NHS Choices Vitamin D
- Patient.co.uk Vitamin D deficiency
- National Osteoporosis Society: Healthy eating for bones: Facts about food
- Royal National Orthopaedic Hospital: Vitamin D dosage guide for children

Appendix 2: OTC preparations

Healthy Start vitamins: Women and children from families who are eligible for the Government’s Healthy Start scheme can get supplements which include vitamin D, in the form of tablets for women and drops for children.

- Vitamin drops contain Vitamins A, C & D (292 units per 5 drops) – dose 5 drops daily
- Vitamin tablets contain Vitamins C, D (400 units per tablet) and folic acid – dose 1 tablet daily

Women qualify for Healthy Start from the 10th week of pregnancy or if they have a child under four years old, and if she or her family receive:

- Income Support, or
- Income-based Jobseeker’s Allowance, or
- Income-related Employment and Support Allowance, or
- Child Tax Credit (but not Working Tax Credit unless the family is receiving Working Tax Credit run-on only) and has an annual family income of £16,190 or less.

Women under 18 and pregnant also qualify even if not on the above benefits.

To obtain free supplies, present a Healthy Start voucher (sent to Healthy Start recipients every 8 weeks).

For further information and application forms, visit [http://www.healthystart.nhs.uk/](http://www.healthystart.nhs.uk/)

Healthy Start vitamins are no longer available for sale, but commercial preparations such as Abidec and Dalivit are available to buy from pharmacies and other health food retailers.

- Abidec – contains Vitamins A, B, C & D (400 units per 0.6ml dose):
  - Under 1 year: dose 0.3ml daily;
  - 1-12 years: dose 0.6ml daily.
  Contains arachis oil: Not suitable for those with peanut allergy.
  Contains sugar so place at the back of the tongue to avoid contact with teeth.

- Dalivit – contains Vitamins A, B, C & D (400 units per 0.6ml dose) – dose: 6 weeks – 1 year 0.3ml (7 drops) daily; Older children, adults and elderly 0.6ml (14 drops) daily.
  Does not contain arachis oil: Suitable for those with peanut allergy.
  Contains sugar so place at the back of the tongue to avoid contact with teeth.

NB: Some vitamin D preparations contain soya oil or peanut oil; most vitamin D capsules contain gelatin. Retailers can provide information on the contents and suitability of their products.
